

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of the claims in the application:

1. (Currently Amended) An image processing apparatus comprising:

an image attribute determining unit to determine an image attribute of an image data;

an object dividing unit to divide the image data into a plurality of objects based on the image attribute; and

an object describing unit to describe the plurality of objects in predetermined formats and convert the plurality of objects into a file of a predetermined file format, wherein the object describing unit describes an object having a predetermined image attribute among the plurality of objects by linking [[an]]one or more additional objects representing attribute information on the predetermined image attribute with the object having the predetermined image attribute, wherein the additional objects are newly created objects other than the plurality of objects and include[[s]]:

an additional object comprising an image pattern ~~that indicates an image attribute~~; and

an additional object that brings said image pattern into invisible state,

wherein the additional object comprising the image pattern is equal in size to the object having the predetermined image attribute.

2. (Currently Amended) The image processing apparatus according to claim 1, further comprising a data converting unit to convert the file of the predetermined file format into a print instruction for a printer and output the print instruction to the printer, wherein

the data converting unit identifies the object having the predetermined image attribute based on the additional objects, and performs an image processing to the object based on the predetermined image attribute.

3. (Currently Amended) The image processing apparatus according to claim 2, wherein when the object having the predetermined image attribute is identified as an object having a text attribute, the data converting unit performs a halftone processing with a higher sharpness to the object having the predetermined image attribute, compared with an object having another attribute than the text attribute.

4. (Currently Amended) The image processing apparatus according to claim 2, wherein when the object having the predetermined image attribute is identified as an object having a text attribute with an achromatic color, the data converting unit performs an image processing to enhance a black color in color correction and black color generation or an image processing to eliminate any remaining color of the object having the predetermined image attribute.

5. (Currently Amended) The image processing apparatus according to claim 2, wherein when the object having the predetermined image attribute is identified as an object having a text attribute with a white background, the data converting unit performs a halftone processing with a higher sharpness to the object having the predetermined image attribute, compared with an object having other attribute than the text attribute with the white background.

6. (Currently Amended) The image processing apparatus according to claim 2, wherein when the object having the predetermined image attribute is identified as an object having a text attribute with a color background, the data converting unit performs an identical halftone processing as that for the color background to the object having the predetermined image attribute.

7-8. (Canceled)

9. (Original) The image processing apparatus according to claim 1, wherein the predetermined file format is a portable document format.

10. (Currently Amended) An image processing system comprising:
an image processing apparatus including

an image attribute determining unit to determine an image attribute of an image data;

an object dividing unit to divide the image data into a plurality of objects based on the image attribute; and

an object describing unit to describe the plurality of objects in predetermined formats and convert the plurality of objects into a file of a predetermined file format, wherein the object describing unit describes an object having a predetermined image attribute among the plurality of objects by linking [[an]]one or more additional objects representing attribute information on the predetermined image attribute with the object having the predetermined image attribute, wherein the additional objects are newly created objects other than the multiple objects and include^{[[s]]}:

an additional object comprising an image pattern that indicates an image attribute; and

an additional object that brings said image pattern into invisible state, wherein the additional object comprising the image pattern is equal in size to the object having the predetermined image attribute; and

a printer to receive the print instruction and print the document.

11. (Currently Amended) An article of manufacture having one or more computer recordable medium storing instructions which, when executed by a computer, cause the

computer to perform a method comprising:

determining an image attribute of an image data;

dividing the image data into a plurality of objects based on the image attribute;

describing the plurality of objects in predetermined formats; and

converting the plurality of objects into a file of a predetermined file format,

wherein describing the objects includes describing an object having a predetermined

image attribute among the plurality of objects by linking [[an]]one or more additional

objects representing attribute information on the predetermined image attribute with

the object having the predetermined image attribute, wherein the additional objects are

newly created objects other than the multiple objects and include^{[[s]]}:

an additional object comprising an image pattern that indicates an image attribute; and

an additional object that brings said image pattern into invisible state,

wherein the additional object comprising the image pattern is equal in size to the object having the predetermined image attribute.

12. (Currently Amended) The article of manufacture according to claim 11, wherein the method further comprises:

converting the file of the predetermined file format into a print instruction for a printer;

identifying the object having the predetermined image attribute based on the additional object;

performing an image processing to the object having the predetermined image attribute based on the predetermined image attribute; and

outputting the print instruction to the printer.

13-15. (Canceled)
